

Industrial Use of Ethyl alcohol as a New Revolution

Dr. Satya Narayan Singh *

Assistant Professor
Radha Govind University
Ramgarh, Jharkhand

Abstract

In our present world the ethyl alcohol is the most important element for our progress. The most famous name of Airtel alcohol is ethanol is a volatile flammable colourless liquid with a 78.37 degree Celsius. Generally ethyl alcohol use and major industries of solvent and antiseptic and hand sanitizer also it use for fuel additive by a fuel and alcoholic beverage. The industrial use of ethyl alcohol is it going high to high. It has a more significant for transformation evolving from a traditional solvent and beverage component into a basic or foundation element of the our earth for the green industrial revolution, which is very eminent for our Earth it is need of today it driven by the need for sensible development of earth energy security of our earth and human kind and the transaction away from the petrochemical elements ethanol is the now being you can like AJ renewal resources in our energy element manufacturing and chemical production no doubt energy is the component of our future. In present the Renewable Energy & Fuel Blending, Green Chemical Feedstock, Industrial Solvent & Manufacturing & the Pharmaceutical & Healthcare Applications are most important area of ethyl alcohol.

Keywords: [Ethyl alcohol, Green Chemical Feedstock Fuel Blending, petrochemical elements, Technological Advancement, gasoline, Biofuel mandate, greenhouse gases, fossil fuel, Fuel Blending]

Introduction

The "New" Revolution Factors of Ethyl Alcohol are as :

1. The Green Energy and Climate Change Pivot

Energy Sector is the key sector for application of ethanol. It is most significant area for that in present world or India. The most prominent work of ethyl alcohol is to fuel Decarbonisation as we know that ethanol is a positioned as a primary to combat our climate change and reducing greenhouses gases from environment.

In simple words we can say that Ethyl Alcohol reducing greenhouse gases emissions from car without requiring immediate change or wholesale changes to the motor industry or car industries which is going to rapidly increase, day by day.

2. Low Emissions Shift

It is very vital for our car industries because our modern car engines can benefit from higher comparison ratio enabled by ethanol which increases fuel efficiency potentially matching or exceeding gasoline. So it is very vital or essential for car industries

3. Biofuel Mandates

Generally Biofuel mandate are government policies which requiring minimum amount of renewal fuel to be blended into a conversional fossil fuel for transport aiming to reduce our greenhouse gases emissions and enhance green energy security in our India society. The mandate significant no doubt in design and emissions across different countries and region and present time Indian government are mixing 15% of Ethanol in fossil fuel and is going to increase 20%. Its also help to save our vital foreign currency which is heavily use for purchase biofuel from different countries. Our country India has an ambitious Ethanol Blended Petrol (EBP) program in present time, with the target of achieving 20% ethanol blending (E20) by year 2025-26 by 2030 to reduce crude oil import dependence. This vital programme provides us guaranteed pricing mechanisms to incentivize production and aims to use various feedstock, including sugarcane and crop residues.

Common Types of Mandates : Some common types of Mandates are as below:

- **Blending Percentage:** Generally It requires a certain percentage of biofuel to be blended into the total fuel supply.
- **Requirement of Volume:** In this type of Mandates a specific total volume of biofuel to be used annually.
- **Greenhouse Gas (GHG) Reduction:** It is necessary in this area fuel suppliers to reduce the overall Greenhouses emissions of their fuel supply by a specific percentage, it allowing the flexibility in choosing high-performance biofuels for various uses.

4. Sustainability & Circular Economy:

The use of ethyl alcohol are very vital for food crops and improves the sustainability of the production process with the help of this process agricultural residue and waste (second-

generation ethanol) reduces dependency on Advanced Applications. No doubt, The development of ethanol-to-aviation fuel facilities marks a new frontier for decarbonizing transportation for every nation.

The uses of ethyl alcohol also provide us the Technological Advancement. In every agriculture based economy Innovative fermentation technologies are enhancing yield and efficiency and reducing the cost of ethanol production in every are of agriculture. We also know that this revolution also faces many hidden challenges, including the "food vs. fuel". It topic of debate in some regions, In present time the need for compatible engine technology for high-blend ethanol, and water-intensive farming requirements for feedstock.

5. The Essential Solvent for Reactions

There is no doubt that ethyl alcohol is one of the most prominent solvent for a variety of reaction in industrial labs in our India. It provide us to ability to dissolve both polar and nonpolar substance make it but it versatile. Generally in present research used it to create solution beer other solvent might be free.

The most common use ethyl alcohol in industrial labs is an antiseptic and disinfected material it is more efficient more cheaper and broad spectrum of bacteria and virus material necessary to maintain a Sterile environment with the help of it we can use regularly clean labs our furniture, our equipment and many more things we can use regularly.

6. Preservation of Biological Samples

Use of ethyl alcohol use increase ability to storage of specimen which is very vital in present science and laboratory. Ethyl alcohol have ability to the denature protein and deactivate enzymes. Ethyl alcohol make it deal for long time storage the uses of alcohol also prevent biological tissues degradation insuring that sample remain valuable for future study so no doubt ethyl alcohol is very vital component in our laboratory and labs. The uses of ethyl alcohol to maintain low cost of laboratory expenses also this process the cellular structure and prevent auto cyclist allowed to for detailed microscope analysis and examination in a lab a worker stand the fixed issues to high light specific structures adding in describing diagnose etc.

7. Component in Culture Media

Generally present era the most Microbiologists are using **ethyl alcohol** to sterilize component before adding them to cultural media. Adding of ethyl alcohol provide us to microbiologist step prevent condom man and ensure that only the Desire Microbiologists will grow.

8. Cosmetics use and personal care use of ethyl alcohol

In cosmetic industry ethanol is a commonly used substance; in this field ethanol provide antiseptic properties that can kill bacteria and virus making it a key ingredient in product. It is also used a solvent in perfumes and fragrance income commonly in present ages which helped to dissolve the Essential oil and other aromatic compound.

Conclusion

No doubt ethanol is very precious for our present India it is a renewal cleaning burning fuel that can reduce dependence of fossil used and their greenhouse gases and save our important expenses foreign currency. It is also a very vital component for our India for development of our nation.
